

Phase V1.8 Release Report

Authentication and cloud sync were added with a dual-mode backend design: local auth fallback for immediate use and Supabase-ready hooks for production cloud sync.

Verified Tests

- ? Auth config endpoint returned the current auth mode and Google login availability.
- ? Email signup completed successfully.
- ? Email login completed successfully.
- ? Authenticated /me lookup completed successfully.
- ? Authenticated save, list, detail, and delete asset flows completed successfully.
- ? Unauthenticated /career-assets still returned the existing public dashboard asset shape.
- ? Unauthenticated generation endpoint access still worked.
- ? Frontend script passed syntax validation with node --check.

Current Environment

- ? Auth mode: local
- ? Google login enabled: False
- ? Public /career-assets shape preserved: dict

Implementation Notes

- ? Existing public generation endpoints remained accessible without authentication.
- ? Authenticated users can save, list, inspect, and delete synced career assets.
- ? Supabase mode is implemented but not active because SUPABASE_URL, SUPABASE_ANON_KEY, and SUPABASE_SERVICE_ROLE_KEY are not configured in the backend environment yet.
- ? Google login is wired for future Supabase activation and is intentionally unavailable in local fallback mode.
