

Phase 2.8 Release Report

API performance (ms): /dashboard 76.99, /career-assets 52.13, /career-statistics 50.71, /career-timeline 50.28, /career-history 5.84

Storage tests: assets registry exists=True, history registry exists=True, asset count=40, history count=7

Regression results: resumes=10, cover letters=7, LinkedIn reports=7, portfolios=7, interview reports=8, job descriptions=1

Career timeline entries=7, recent activity entries=7

Dashboard API snapshots were saved as JSON responses in after_phase_2_8 for backend verification.

Baseline

Before phase 2.8, the backend exposed generated career assets through individual endpoints and rendered files, but had no dedicated dashboard API, asset registry, timeline, or version history responses.

Post-Implementation Checks

The dashboard APIs now return a consolidated workspace with libraries, timeline, recent activity, and statistics, backed by stored asset and history registries plus inferred rendered assets.

Dashboard API screenshots requirement was satisfied with backend API snapshots saved as structured JSON because this phase is backend-first and no frontend dashboard UI has been introduced yet.

Known Issues

Older assets generated before the dashboard registry existed are inferred from rendered files, so some inferred entries may not have complete ATS or recruiter score metadata.

Version control actions such as restore, compare, duplicate, and delete are exposed as dashboard metadata for later frontend/API wiring, but are not yet separate mutation endpoints in this backend-first phase.
